GO-TO-MARKET (GTM) STRATEGY

MeshTab: Cross-Currency Group Settlement on Monad

Close the tab. Keep the friends.

October 2026 | Version 1.0

Document Information

Product Name	MeshTab
Team	**Osasumwen Ngozi Scott**: Co-founder and Product Lead (ONSInsights) **Miracle Aigbomian**: Co-founder and Developer (miracles2motion)
Document Scope	Positioning, market segmentation, competitive differentiation, messaging, business model and financial scenarios, launch plan, pilot plan, acquisition, risks and metrics. The problem statement is in the PRD. Technical positioning is in the Technical Brief.
Event / Track	Monad Metropolis Hackathon, Consumer Products & Payments
Product Stage	MVP prototype build on Monad Testnet. No revenue and no real money today.
Document Status	Final
Companion Documents	PRD v1.0, Product Brief v1.0, Technical Brief v1.0
Last Updated	October 2026

1. EXECUTIVE SUMMARY and MARKET POSITIONING

MeshTab turns the tangle of a group trip into one short payment list and one tap. Friends who spend across currencies log costs in one place, MeshTab nets everyone's balances into the fewest payments, and each person settles in one tap with no gas fee. This GTM strategy covers how MeshTab reaches its first users, how it positions against the alternatives, and how it could earn revenue without charging for the things that make groups join.

1.1 Core Positioning Statement

For friend groups who spend across currencies, MeshTab is the group-expense app that nets everyone's balances into the fewest payments and settles them in one tap.

Unlike expense trackers that stop at the IOU list, or wallet apps that expect crypto know-how, MeshTab turns a trip's tangle into one short list and one tap. Close the tab. Keep the friends.

1.2 Messaging Hierarchy

Layer	Line	Where it is used
Brand promise	Close the tab. Keep the friends.	Landing hero, social content, README, covers of every document
Consumer one-liner	Split in any currency. Settle in one tap.	App manifest, short descriptions
Product value	Group expenses, netted into fewer payments.	Meta description, link previews, store listings
Technical positioning	Cross-currency debt netting and one-tap, sponsored on-chain settlement on Monad Testnet.	README, hackathon submission, Technical Brief, judge-facing material

1.3 Core Value Propositions

Value	What users get	Proof today
Fewer payments	One payment list across currencies instead of one list per currency	Property: payments never exceed non-zero members minus 1. Illustrative benchmark: 9 payments become 3 (PRD Appendix A)
One tap, no crypto	Passkey sign-in, no seed phrase, no gas to buy	Sponsored gas on testnet. Measured tap-to-confirmed median: 1.28 s over 10 runs (PRD M-05)
Trust you can check	Visible math, a $0.00 reconciliation, and a receipt for every payment	Net positions, before/after graph and explorer links (PRD FR-15, FR-18)
Built for travel	Nine currencies and offline expense logging	Six live rates, three labeled indicative. Offline settlement is not possible and is not claimed

1.4 GTM in One View

Phase	Window	Goal	Audience	Gate to move on
0. Hackathon	Now through the judging window after Oct 13	Be understood, tested and verified by evaluators	Judges and reviewers reading public materials	PRD Verification Register items marked Must are closed
1. Testnet pilot	4 to 6 weeks after submission	Validate usability and the invite loop with real groups using test funds	Friend groups planning trips	Pilot metrics collected (Section 9)
2. Mainnet pilot	After security review, legal check and partner coverage	Validate real settlement and willingness to pay at small value	10 to 20 groups	Audit or scan complete, legal opinion, ramp coverage confirmed
3. Public launch	After Phase 2	Scale through invite loops and content	Beachhead groups, then adjacent segments	Unit economics measured, not assumed

Evidence status. No primary market research has been run. External statistics used are limited to those with a named source (Appendix A). Segments, channels, prices and conversion rates are hypotheses, and the plan to test them is in Section 6. The financial figures in Section 5 are scenario assumptions from the companion model, not forecasts.

1.5 How Cross-Currency Netting Works

A judge should not have to open the PRD to understand the core mechanism. Here it is in five steps:

- **One dollar unit.** Every expense is entered in its own currency and converted to dollars once, at entry. Six currencies use live rates (Pyth). Three use labeled indicative rates. The dollar value is stored in whole cents and is never recalculated when rates move.
- **Deterministic rounding.** Equal splits that do not divide evenly hand the extra cents out in a fixed order. The same inputs always give the same result, and every tab's balances sum to exactly $0.00.
- **Net positions.** Each member's position is what they paid minus their share of every expense. The app shows each position, so every obligation can be explained.
- **Greedy matching.** Debtors are paired with creditors until every position is zero. The result is at most (members with a non-zero balance minus 1) payments. It is not guaranteed to be the theoretical minimum.
- **Exact payments.** Each payment is made for exactly the displayed amount, in the settlement token. Consistency between the calculation, the displayed list and the on-chain amount is a PRD acceptance criterion (US-07, US-08), tested by property tests and a proof settlement and tracked in the Verification Register (V-03, V-16).

FX exposure, stated plainly. Because obligations are fixed in dollars at the rate on the day each expense was entered, a member whose home currency moves before they cash out bears that difference. MeshTab does not hedge, refund or guarantee a local-currency value. The prototype also settles in a testnet token, and cash-out to local currency is not built.

1.6 Why Settle On-Chain?

A fair challenge is: why not use a database and existing payment rails? Expense recording and netting do not need a blockchain, and MeshTab keeps them off-chain. The on-chain layer is for the transfer.

Layer	Needs a blockchain?	Reason
Expense recording	No	Works in any database. Kept off-chain
Netting calculation	No	Runs in the app. Kept off-chain
Moving money between friends	A benefit, not a necessity	A public receipt both sides can verify. Works across borders between friends who share no bank rail. One-tap flows through smart accounts and sponsored gas. Fast finality (800 ms published) and a measured tap-to-confirmed time of about 1.3 seconds
Funding and cash-out	Not solved yet	Planned through partners. Coverage is unconfirmed

For same-country groups on a shared bank rail, a conventional payment can do the job. The on-chain layer earns its place where friends sit in different countries, banks and currencies and need one verifiable receipt. If the pilot shows groups do not need that, the positioning must narrow. The submission demonstrates the claim with a live sponsored settlement and a public explorer receipt.

2. TARGET MARKET SEGMENTATION and ICP

MeshTab is not a bill-splitting product for everyone. Its first market sits where group expenses, cross-border money friction, digital payment habits and low tolerance for payment friction overlap.

2.1 Segmentation Summary

Dimension	Primary segment	Notes
Geographic	Cross-border financial corridors: people who share expenses while using different currencies, banks or payment systems	Examples of environments, not fixed markets: Lagos, London, Dubai, Nairobi, New York, Bali, Chiang Mai. Includes travel hubs, nomad and remote-work communities, international students, and friend networks spread across countries
Demographic	Digitally active adults, roughly 20 to 38, with emphasis on Gen Z and younger Millennials	Travelers, nomads, remote workers, students, freelancers and young professionals. Income is not a strict requirement. Regular discretionary spending and comfort with digital finance matter more
Psychographic	People who want money coordination to be simple and socially comfortable	Relationship conscious, friction averse, convenience oriented, cost conscious, digitally comfortable, open to new payment technology. Interest in crypto is not required
Behavioral	People who regularly share expenses	The Group Fronter (pays upfront), the Deferred Settler (accumulates small debts), the Cross-Border Spender (mixed currencies), and the Friction-Averse User (abandons complicated payments)

2.2 Beachhead Segment

Digitally active international travel and remote-work groups, roughly 20 to 38, where members regularly share expenses, one or more people often pay upfront, and members use different currencies or financial systems.

It combines three conditions MeshTab is designed to address: group spending, cross-border financial friction, and repeated settlement. The beachhead is a hypothesis to be tested in the pilot, not a proven

market. The first corridor within it is chosen by where the founders can actually recruit (2.5).

2.3 Ideal Customer Profile

Attribute	Qualifies	Disqualifies today
Group size	3 to 15 people (20 is the hard ceiling)	Groups larger than 20
Currencies	Members or the trip involve at least two currencies	Single-currency groups. They can use MeshTab, but the payment count matches other tools and only the settlement edge applies
Behavior	At least one person regularly fronts costs. Several people owe at once	Groups that already settle on the spot
Devices	Phones that support passkey sign-in, or Google and email fallbacks	None
Attitude	Open to a new payment tool. No crypto interest needed	Groups that need cash-out to local currency on day one (not built), or enforcement of payment (not built)

2.4 Segment Priority

Priority	Segments	Personas (PRD)	Why
Primary beachhead	International travel and remote-work groups with recurring shared costs and cross-border ties	Aisha, Kemi, Ben, Danny	The core loop solves their main pain, and they appear in the demo benchmark
Secondary	International students, young expatriate communities, digital nomads, frequent group travelers, roommates and local groups	Sarah, Liam, Tunde	The core loop helps. The edge is smaller (single currency) or depends on roadmap items such as cash-out
Early adopters	Crypto-curious users, stablecoin users, Web3 communities	Alex	Comfortable with on-chain settlement. Not the whole market, because the problem exists without crypto
Adjacent, not designed for	Domestic roommates wanting reminders, self-custody users, users wanting an unalterable ledger	Chloe, Alex, Elena	Needs are partly met or not met today. The PRD states the gaps

2.5 Narrowing the First Experiment

MeshTab will not choose its first corridor from a map. It will choose it from where the founders can actually recruit. The corridor is fixed after the first five groups are recruited, using three tests: reachable by the founders, shares costs across currencies, and observable during a real trip. Corridors that match the personas (Lagos, London, Toronto, Lisbon) are candidates only if recruitment confirms them.

Rung	Recruiting pool	Why this order	What we learn
1	The founders' own circles: friends who travel or share costs	Fastest and most honest feedback	Usability and the first funnel numbers
2	Friends of friends, through the organizers' own groups	Tests the invite loop with people who did not meet us	Invite acceptance and activation
3	Online communities the founders already belong to (travel, nomad, student, diaspora, builders)	Tests community and content channels without cold outreach	Sign-ups per community and which message works

2.6 Bottom-Up Pilot Funnel (Illustrative)

There is no global market-size figure here, because there is no evidence behind one. Instead, the Financial Model's Pilot_Funnel sheet estimates how many groups the founders' own reach could produce and what the funnel would look like. Every input is a yellow placeholder. Replace them with real counts: how many people could each of you message this week?

Step	Illustrative input	Result
Warm network: 2 founders x 30 contacts	40% share costs on trips or events, 25% willing to run a group	6 groups
Online: 5 communities x 200 reached	2% interested, 20% of those bring a group	4 groups
Pilot groups	Target is 10 to 20	**10** (no shortfall against the minimum)
Members invited (5 per group)	60% join, 70% activate	40 invited, 24 join, 16.8 activate
Groups that reach a netted list, then settle	60% reach a netted list, 90% of those settle	6, then 5.4
Members who later start their own tab	15% of activated members	2.5 new tabs
Growth estimate	(members minus 1) x acceptance x activation x own-tab share	**0.25** new tabs per tab

Reading this. Even with generous placeholders, the invite loop alone yields about a quarter of a new tab per tab. Invitations on their own would not sustain growth. Growth needs content and community channels too, and the pilot's job is to replace each placeholder with a measurement.

3. COMPETITIVE LANDSCAPE and DIFFERENTIATION

Other products are described by category in this document. Named, sourced evidence is in the PRD, Appendix B (references S1 to S6). Statements describe typical category behavior, and individual products vary.

3.1 Categories

Category	What it does well	Where it stops	MeshTab response
Web2 expense trackers	Record shared costs. Simplify debts within a currency. Offline entry is common	Net each currency separately. In-app payment, where it exists, is limited to a few countries and bank rails	Net across currencies, then settle in the same app
Web2 payment apps	Fast, familiar transfers, mostly domestic	Do not net a group. Each person pays each person	One netted list, then one tap per payment
Multi-currency accounts and neobanks	Low-cost FX and international transfers. Some offer group-bill features	Each person needs an account. Group -bill features may record without moving money for non-customers	Friends need only a passkey, not an account with a provider
Web3 payment apps and wallets	Instant stablecoin settlement	Expect wallets, seed phrases and gas. Do not net groups	Passkeys, sponsored gas, and group netting

3.2 Layer Comparison

Category	Tracks shared costs	Nets within a currency	Nets across currencies	Settles in-app	Crypto-free sign -in
Web2 expense trackers	Common	Common	Rare	Varies by country	Yes
Web2 payment apps	Rare	No	No	Yes (domestic)	Yes
Multi-currency accounts	Varies	No	No	Yes (account	Yes

Category	Tracks shared costs	Nets within a currency	Nets across currencies	Settles in-app	Crypto-free sign-in
				holders)	
Web3 payment apps	Rare	No	No	Yes	Rare
MeshTab	Yes	Yes	Yes	Yes (testnet)	Yes

Generalized from category evidence. Not a claim about any single product.

3.3 Where We Win and Where We Do Not

Situation	Where MeshTab wins	Where it does not
Multi-currency groups	One netted list instead of a list per currency, then in-app settlement	None
Friends without wallets or accounts	Passkey sign-in and sponsored gas	Cash-out to local currency is not built
Single-currency groups	One-tap settlement	Payment count matches existing tools, so we make no count claim
Offline logging	Works	Not a differentiator, because it is common in this category
Getting everyone to pay	Clear list, one tap	Nothing enforces payment. We do not claim it

3.4 Defensibility

MeshTab does not claim a moat today. Cross-currency netting can be copied. The durable advantages we will test are: the network effect of tabs (each tab brings 2 to 14 people), the depth of the settlement experience (passkey plus sponsored gas), and partnerships for funding and cash-out. If none of these produces measurable retention in the pilot, the positioning must change.

4. MESSAGING PILLARS and BRAND ANCHORS

4.1 Messaging Pillars

Pillar	Message	Proof	Avoid
Clarity	See exactly who owes whom.	Net positions, before/after graph, $0.00 reconciliation	Percentage headlines
Simplicity	No wallets. No seed phrases. No gas.	Passkey sign-in, sponsored gas	Chain jargon, and "free" beyond testnet gas
Trust	Check the math. Check the receipt.	Visible calculation, explorer receipts, honest labels	"Trustless," "audited," "decentralized"
Speed	One tap.	Measured tap-to-confirmed median of about 1.3 seconds	"Instant"

4.2 Message by Audience

Audience	Message	Language
Organizers	Stop chasing. Get paid back in one tap. You're a friend, not a bank.	Outcome words only. No chain terms
Members who owe	See what you owe. Pay them back before the vibe shifts.	Plain, light, no jargon

Audience	Message	Language
Cross-border travelers	Every currency, one list, one tap.	Mention currencies and the single list
Crypto-curious users	Stablecoin settlement without the setup.	Name the rails once, then keep it simple
Judges and reviewers	Cross-currency netting with one-tap sponsored settlement, verifiable on-chain.	Technical, with properties and a reproducible example

4.3 Tagline System

- **Master tagline:** Close the tab. Keep the friends.
- **Organizer line:** You're a friend, not a bank.
- **Debtor line:** Pay them back before the vibe shifts.
- **Campaign series:** "Friendships shouldn't end over $47." Each video shows a different awkward money moment, then the one-tap fix. Supported by the sourced survey figure (14% of Gen Z ended a relationship over repayment; US sample, PRD Appendix B S1).
- **Hero block:** Headline: Close the tab. Keep the friends. Subline: Group expenses, without the awkward money conversations. Body: Log expenses in any currency. MeshTab nets them into fewer payments, and everyone settles in one tap. Buttons: Start a tab, Try the sample.

4.4 Voice and Tone

Warm, witty and honest. Short sentences. Friend-in-the-group-chat energy, never a bank's. Testnet is stated up front, because honesty is part of the brand.

4.5 Claims Guardrails

Never say	Say instead
Never chase again	Get paid back in one tap.
Instant settlement	Confirms in about 1.3 seconds (testnet median of 10 runs).
Free	No gas fees for you (sponsored on testnet).
Trustless, audited, decentralized	Payments are verifiable on-chain. Unaudited testnet prototype.
First, only, best	Describe the specific edge and show the example.
Saves 75%	Fewer payments. Example: 9 become 3.

5. BUSINESS MODEL and MONETIZATION

Implemented vs proposed. Today MeshTab is a free testnet prototype with no revenue. Everything in this section is a proposal or a scenario. The numbers come from the companion Financial Model (Excel, v1.1) using its default assumptions and are illustrative, not forecasts. Items marked Placeholder in the model are still at zero and understate cost.

5.1 Principles

- **Free core.** Logging, netting, settlement and groups of up to 15 stay free, because every tab brings 2 to 14 new users. The invite link is the acquisition channel.
- **Monetize incremental value,** not essential participation.
- **Do not charge on settlement volume.** Netting shrinks the money that moves, so a volume fee earns little and penalizes the feature we sell.

- **No FX markup, no ads.** Both would contradict the fair, trustworthy positioning.
- **Stage-gate regulated streams.** Ramps, card and balance-based revenue wait for mainnet, partner coverage and a legal opinion.

5.2 Why Netting Changes the Revenue Math

In the illustrative benchmark, a group spends $1,499.10 but only $391.54 actually moves. A 1% fee on settled value would earn about $3.92 for the whole tab. At 100,000 tabs a year that is about $392,000 even at 1%, with the fee charged on the product's own core benefit. The more valuable moments come after settlement: when money goes out to a bank, gets spent, or is managed by an organization.

5.3 Free vs Paid Fence

Always free	Proposed paid (Trip Pass, one-time)	Proposed paid (B2B, monthly)
• Log expenses in any currency • Cross-currency netting with visible math • One-tap settlement • Invite and join • Groups up to 15 (fair-use gas cap)	• Downloadable expense summaries • Enhanced records and history • Expanded receipt-scan allowance • Larger groups beyond the free size	• Admin oversight and group reporting • Exports • Multiple groups under one organization • Support for tour operators, co-living managers and teams

Paid features follow cost or power use. None of them exists today.

5.4 Revenue Streams

Stream	Status	Mechanism	Evidence today	Gating
Trip Pass	Proposed	One-time purchase for convenience and documentation per trip. Suits episodic use better than a monthly plan	None. Price points are hypotheses	Define, build and test the offer
B2B operator subscription	Proposed	Monthly plan for tour operators, co-living managers and teams	None. No customers or pilots	Paid pilot commitments before building a module
Fiat on/off-ramp share	Roadmap, not modelled	Partner fee share through Privy's funding features	Provider terms unknown. Currency and network coverage unconfirmed	Mainnet, coverage, KYC, legal
Spend (card) share	Roadmap, not modelled	Interchange share on a virtual card through Privy's card program	Program is in private preview with onboarding. Terms unknown	Program access, mainnet, compliance
Retained-balance share	Roadmap, not modelled	Partner revenue share on balances kept after settlement	Unknown	Custody design, legal opinion
Referrals	Idea, not modelled	Fees from travel, FX or cash-out partners	Unknown	Brand and trust review

5.5 Steady-State Monthly Scenarios

Source: Financial Model, Scenarios sheet. Monthly, USD. Assumes 5 members per group, 3 settlement payments per group, card processing at 2.9% + $0.30, OCR at $0.005 per scan (15 scans per paying group and 5 per non-paying group), gas at $0.001 per payment, and $80 in fixed monthly costs.

Monthly metric	Conservative	Base case	Optimistic
Active groups	500	2,500	10,000
Trip Pass price and conversion	$2.99 at 3%	$4.99 at 7.5%	$9.99 at 15%

Monthly metric	Conservative	Base case	Optimistic
Expected Trip Pass purchases	15	187.5	1,500
Gross Trip Pass revenue	$44.85	$935.63	$14,985.00
Card processing fees	($5.80)	($83.38)	($884.57)
Net Trip Pass revenue	$39.05	$852.24	$14,100.44
B2B accounts and price	2 at $29	10 at $49	50 at $99
Gross B2B subscription revenue	$58.00	$490.00	$4,950.00
Revenue after B2C processing fees	**$97.05**	**$1,342.24**	**$19,050.44**
Receipt-scan (OCR) cost	($13.25)	($71.88)	($325.00)
Network gas	($1.50)	($7.50)	($30.00)
Contribution after variable costs	**$82.30**	**$1,262.87**	**$18,695.44**
Fixed monthly costs	($80.00)	($80.00)	($80.00)
Illustrative operating contribution	**$2.30**	**$1,182.87**	**$18,615.44**

Expected purchases can be fractional because they are expected values. Operating contribution is not profit or cash flow. It excludes salaries, taxes, legal and compliance, acquisition spend, B2B processing and support, working capital and capital expenditure. Paymaster fees, platform cost per user and B2B serving cost are placeholders at $0 (see 5.7).

Reconciliation. Using the originally proposed assumptions (1 payment per group, no placeholders), the model reproduces every figure in the original proposal to the cent. The only differences in the table above come from assuming 3 payments per group instead of 1, which adds gas cost.

5.6 Unit Economics and Scale

Per active group, monthly	Conservative	Base case	Optimistic
Revenue after processing fees	$0.19	$0.54	$1.91
Variable cost	$0.03	$0.03	$0.04
Contribution	$0.16	$0.51	$1.87
Trip Pass-only contribution (B2B excluded)	$0.05	$0.31	$1.37
Break-even groups against the $80 fixed cost (Trip Pass only)	1,646	259	58

Reading this. Revenue per active group is cents. The $80 fixed cost is only infrastructure and tooling, so break-even against it says little about the business. As an illustration, covering $10,000 a month of operating cost from Trip Pass alone would need roughly 32,000 active groups in the Base case. The model is a tool for seeing what scale and price are required, not a claim that MeshTab reaches it.

5.7 What Moves the Result

Sensitivity (Base case, monthly operating contribution). Source: Financial Model, Sensitivity sheet.

Test	Result	Reading
Trip Pass conversion and price grid	$419 (2%, $1.99) to $3,846 (15%, $9.99)	Price and conversion are the two largest levers
Driver ranking, each moved 20%	Price $363, conversion $337, groups $309, B2B accounts or price $196, fixed costs $32, OCR cost $29, payments per group $3	Revenue drivers dominate. Cost drivers modelled today barely matter
Platform cost of $0.05 per user per month	Base case falls from $1,183 to $558 (down 53%)	The largest missing cost. Provider pricing must be verified
Platform cost of $0.10 per user per	Base case becomes negative ($67). Conservative	Unit economics depend on this one

Test	Result	Reading
month	is negative at $0.02	number

5.8 Downside Stress Scenario

Source: Financial Model v1.1, Stress sheet. Base case volume (2,500 groups, 12,500 users) with a weaker commercial case: 3% Trip Pass conversion, no B2B accounts, and a platform cost of $0.05 per user per month. The $0.05 is illustrative. It is not a provider quote or a verified cost.

Monthly, USD	Base case	Stress
Revenue after processing fees	$1,342.24	$340.90
Total variable costs	($79.38)	($698.75)
of which platform cost	$0.00 (placeholder)	($625.00)
Contribution after variable costs	$1,262.87	($357.85)
Fixed monthly costs	($80.00)	($80.00)
Illustrative operating contribution	**$1,182.87**	**($437.85)**
Platform cost per user at which the stress case breaks even	n/a	about $0.015

Reading this. Under these assumptions the business loses money at Base volume. The result turns on one unverified number: if platform cost per user per month stays under about 1.5 cents, the stress case breaks even. Obtaining real provider pricing is therefore the most valuable single item in the financial work.

5.9 Twenty-Four Month Ramp (Base case)

Source: Financial Model, Ramp24M sheet. Active groups ramp linearly to 2,500 over 12 months and B2B starts in month 7 and ramps over 12 months. Cumulative operating contribution is about $4,921 at month 12 and $18,503 at month 24, with a monthly figure of $938 at month 12 and $1,183 at month 24. These results are not a break-even forecast, because the model excludes team costs. They show only that the modelled cost base is small.

5.10 Unmodelled Upside

Ramps, card spend, retained balances and referrals are excluded from the base case. The model includes an illustrative sizing block with round placeholder inputs (5% of users on a ramp monthly at $100 and 30 basis points, and 10% keeping a $50 balance at 50 basis points a year). On those inputs the two streams add about $43, $214 and $854 a month in the three scenarios, which is 44%, 16% and 4.5% of revenue after fees. These inputs are not evidence. The point they illustrate is that take rates on small balances are small, so this upside needs volume, partner terms and regulatory clearance to matter.

5.11 Exclusions and Limitations

- Excluded: transaction or settlement fees, fiat ramps, cards, features not yet implemented, unverified gas savings, and any customer, conversion or revenue figure that has not been measured.
- Excluded costs: salaries, taxes, acquisition spend, legal and compliance, working capital, capital expenditure, B2B processing fees and B2B support.
- Open cost questions: mainnet gas per settlement, paymaster and bundler fees, authentication and wallet platform fees per user, indirect tax on digital goods across countries, and how Trip Pass is paid for (card billing assumes a payment integration that does not exist today).
- A legal opinion is needed before charging anything, because treatment of money-transmission and e-money rules may depend on whether fees are for software or for moving funds.

5.12 Pricing and Model Validation

Hypothesis	Test	Proposed decision rule
Free group coordination drives organic adoption	Invite acceptance, onboarding, group completion, repeat use in the pilot	Fix the funnel if activation is well below target before testing any pricing
Users will pay for Trip Pass convenience	Clearly defined offers at $2.99 and $4.99, then higher where justified	Compare completed purchases and contribution margin, never stated interest alone
Operators will pay for admin features	Problem interviews with operators and paid pilot commitments	No B2B module without meaningful commercial evidence
OCR limits control cost without hurting use	Measure scans, cost and manual fallback	Set free limits from measured cost and observed impact
Settlement costs stay viable on mainnet	Benchmark real transactions, gas and paymaster fees	Reassess batching or design if costs exceed the chosen threshold

Numeric thresholds used in experiments are proposed internal targets, not industry benchmarks, and will be revised as evidence arrives.

5.13 Model Governance

The financial model keeps assumptions in one place and recalculates every output from them. It distinguishes implemented from proposed features, observed data from hypotheses, assumptions from verified costs, revenue after fees from profit, and prospective customers from actual ones. Its Checks sheet currently reads PASS with three warnings (the three placeholder costs). Version 1.1 added the Stress and Pilot_Funnel sheets and was verified to leave every formula and value on the original sheets unchanged. The model is described as verified only to that extent. Replace assumptions with measured data as it arrives and recheck before citing any figure externally.

6. MARKET VALIDATION and ACQUISITION ALIGNMENT

External evidence identifies the market. User research validates the problem. This section separates what we know from what we assume, and says how we will close the gap.

6.1 What We Know and What We Assume

Statement	Status	GTM implication
76% of Gen Z who fronted group costs were not fully repaid. 14% of Gen Z and 19% of Millennials ended a relationship over repayment (US sample)	Sourced (secondary)	Supports the emotional hook and the organizer pain. Not evidence for MeshTab's cross-border segment
Common expense trackers net debts per currency	Sourced (category behavior)	The basis of the cross-currency edge
In-app payments in such trackers are limited to a few countries and bank rails	Sourced (category behavior)	The basis of the settlement edge
Cross-border groups share costs often enough to matter	Hypothesis	Tested in the micro-survey (6.2)
Non-crypto friends will complete passkey sign-in and pay	Hypothesis	Tested in moderated sessions (PRD M-02, M-03)
People will pay for Trip Pass or B2B plans	Hypothesis	Tested only after the invite loop is proven (5.12)
External statistics about cross-border payment cost and travel trends cited in earlier drafts	Not verified here	Not used in this document until sources are confirmed (Appendix A)

6.2 Validation Sprint

A lightweight sprint that fits a two-person team. It is optional before submission and required before any

pricing work.

Activity	Scope	Proposed decision rule
Micro-survey	20 to 30 people from your network who travel or share costs with friends. About 8 questions: how often you split costs, whether you front costs, how many currencies, how repayment is done today, what annoys you most, willingness to try a one-tap app	If fewer than half report fronting costs or mixed currencies, revisit the beachhead before spending on acquisition
Moderated sessions	5 first-time testers on the live app (PRD Section 12.2)	Fix onboarding if fewer than 4 of 5 complete the self-test path
Fake-door pricing probe (later)	After the invite loop works: show a clearly labeled Trip Pass offer and count taps	Build the offer only if tap-through is meaningful and purchases follow

Thresholds are proposed internal targets, not benchmarks.

6.3 Insight to Decision

Insight needed	How we collect it	GTM decision it drives
How often groups span currencies	Micro-survey	Whether cross-border is the right lead segment
Where repayment breaks down today	Survey and sessions	Which message leads: chasing, fees, or complexity
Invite acceptance and activation	Pilot analytics	Whether growth can be product-led
Willingness to pay	Pricing probe and paid pilots	Whether to build Trip Pass or B2B

7. ONBOARDING and ACTIVATION

7.1 Aha Moments

Who	Aha moment	Why it matters
Organizer	Sees one netted payment list from a messy multi-currency tab	Proves the value in under a minute and motivates inviting everyone
Member	Pays in one tap, with no wallet setup	Removes the crypto fear and proves the settlement edge
Judge or tester	Reproduces the claims with their own numbers	Turns claims into evidence

7.2 Onboarding Principles

- Passkey first, with Google and email as fallbacks. No wallet language anywhere in the primary flow.
- Joining is one tap from a link in a group chat, and a returning user lands in the tab.
- The sample tab needs no sign-in, so anyone can see netting before committing.
- Technical detail sits behind "View receipt." Testnet and test-funds labels are always visible.

7.3 Activation Funnel

Step	Metric	Proposed target	Source
Sign in	Reaches the home screen	Within 10 seconds on 4G	PRD US-01
Create or join a tab	Joins from a link	Invite acceptance, target set after pilot baseline	PRD US-02, US-03
First expense	Time to first split	Median under 30 seconds	PRD M-02
See the netted list	Netting viewed	Majority of tabs with 3+ expenses	Pilot analytics

Step	Metric	Proposed target	Source
Settle Up	Opened, then confirmed	90% of openers complete	PRD M-03

Targets are proposals until the pilot sets a baseline.

8. GTM LAUNCH PLAN

8.1 Phase 0: Hackathon (now through judging)

The audience until judging is evaluators. The goal is to be understood, tested and verified. Sponsors and judges are not contacted privately. All claims rest on public documentation.

Asset	Purpose	Status
Live app and sample tab	Let judges test with their own numbers	Live. Landing copy confirmed
Demo video (75 seconds, script v2)	Show netting, receipt scan, one-tap settlement	Ready to record after the final dual-device run
README and Product Brief	Explain the product accurately and briefly	README update on hold. Brief final
Evidence pack	Transaction links, property-test log, timing table, written benchmark output	In progress (PRD Verification Register)
Self-test path	Five-minute path from landing to a verified settlement	Defined (PRD 12.1). User testing pending
Own-channel posts	Share the project through your own accounts and communities	Optional

8.2 Channels (all hypotheses)

Channel	Mechanism	Phase	Metric	Cost
Invite links	Organizer shares a tab link in a group chat	1 onward	Invite acceptance, activation	None
Group-chat sharing	Members forward the link or a result summary	1 onward	Members who start their own tab	None
Short-form content	"Friendships shouldn't end over $47" series	0 and 1	Views to sign-ups	Time
Creators and communities	Travel, nomad, student and diaspora communities	1 and 2	Sign-ups per community	Time, possibly small gifts
Monad builder community	Ecosystem channels open to all builders	0 and 1	Visits and feedback	None
B2B outreach	Direct conversations with tour operators and co-living managers	After the consumer pilot	Paid pilot commitments	Time

8.3 Campaign Messaging by Channel

Channel	Lead message	Call to action
Short-form video	The awkward "any update on the money?" text, then the one-tap fix	Try the sample tab
Group-chat link	Close the tab. Keep the friends.	Join the tab

Channel	Lead message	Call to action
Communities	Every currency, one list, one tap.	Start a tab for your next trip
Builders	Cross-currency netting and sponsored one-tap settlement on Monad Testnet	Run the self-test path

8.4 Partnerships (post-hackathon, subject to coverage)

- **Privy funding and card programs:** the planned route for fiat funding, cash-out and a virtual card. Network, asset and currency coverage, including NGN, are not confirmed. The card program is in private preview with guided onboarding.
- **Travel and nomad communities:** distribution partners for the beachhead.
- **Co-living and tour operators:** candidates for B2B pilots.

9. PILOT ROLLOUT PLAN

Parameter	Details
Duration	4 to 6 weeks, starting after submission
Environment	Phase 1: Monad Testnet with the issuer's testnet token (play money). Phase 2: mainnet at small value, only after the gates in Section 1.4
Cohort	10 to 20 real groups of 3 to 15 members, planning or taking a trip
Selection	Meets the ICP in 2.3. Mix of corridors (examples from the personas: Lagos, London, Toronto, Lisbon). At least one organizer who fronts costs
Incentives	Early access and a free Trip Pass during the pilot. No cash incentives
Feedback	Group chat per cohort, a short survey after each trip, and 5 moderated sessions
Exit	Proceed, change, or stop based on the success measures below

9.1 Pilot Success Measures (proposed)

Measure	Proposed target	Decision
Invite acceptance	Majority of invited members join	If low, fix the invite flow before anything else
Tabs with 3+ expenses reaching a netted list	Majority	If low, fix logging friction
Settle Up completion	90% of openers	If low, fix settlement UX
Members who later start their own tab	Baseline set in the pilot	Sets the viral estimate in Section 10
Comprehension and trust	4 of 5 testers explain who pays whom and what is real	If low, revise copy and labels
Willingness to pay	Measured through a fake-door offer	Build Trip Pass only if purchases follow

Targets are proposed internal thresholds, not benchmarks.

10. ACQUISITION STRATEGY

10.1 Product-Led Loops

Loop	Trigger	Mechanism	Metric
Invite loop	An organizer creates a tab	Shares a link in the group chat. Each tab	Invite acceptance, activation

Loop	Trigger	Mechanism	Metric
		brings up to 14 more people	
Next-tab loop	A member finishes a tab	Starts their own tab for their own trip or group	Members who start a tab within 90 days
Content loop	A group shares a result	Idea to test: a shareable netting summary. Not built	Shares per tab, sign-ups from shares
Community loop	A community adopts MeshTab for trips	Repeated tabs inside the same community	Tabs per community

Growth measure. Joins inside an existing tab do not grow the base on their own. Real growth is members who later start their own tab. A working estimate: new tabs per tab = (average members minus 1) x invite acceptance x activation x share who start their own tab. Every term is unmeasured today and the pilot sets the baseline.

10.2 Cost of Acquisition

Invited members cost almost nothing to acquire. Organizers come through content and communities, mostly for time. Paid advertising is excluded from the base case and from the financial model. Acquisition spend is therefore a modelled-out cost, and would be added once a paid channel is tested.

10.3 Retention

Usage is episodic: people take a few trips a year. Retention depends on being the default tab for the next trip. An in-app Ping All nudge exists (a notification and an activity item only). Push, email and SMS reminders and re-engagement are roadmap items, and seasonal peaks are a hypothesis to check in the pilot.

11. CUSTOMER FEEDBACK and ITERATION FRAMEWORK

Channel	Cadence	Use	Owner
In-app feedback and pilot group chats	Continuous	Capture friction and confusion in real time	Product Lead
Moderated sessions	Before submission, and each pilot cohort	Observe onboarding and settlement	Product Lead
Post-trip survey	After each pilot trip	Measure comprehension, trust and willingness to pay	Product Lead
Analytics review	Weekly	Review the events in PRD Section 3.1 against targets	Developer
Decision review	Every two weeks	Proceed, change or stop each hypothesis	Both founders

12. RISKS and MITIGATION

ID	Risk	Likelihood	Impact	Mitigation	Owner
G-01	Beachhead demand is smaller than assumed	Medium	High	Micro-survey and pilot before spending on acquisition	PM
G-02	Low invite acceptance or activation	Medium	High	Fix the funnel first. Do not test pricing until fixed	PM
G-03	Episodic use limits retention	High	Medium	Per-trip pricing, "next trip" re-engagement, community adoption	PM
G-04	Platform, paymaster or gas costs per	Medium	High	Verify provider pricing. Use the model's sensitivity	Dev

ID	Risk	Likelihood	Impact	Mitigation	Owner
	user exceed assumptions			analysis	
G-05	Regulation of fees, ramps, card and balances	High	High	Legal opinion before charging. Keep regulated streams out of the base case	PM
G-06	Dependence on partners (Privy, Stripe, Bridge, Pimlico, Monad)	Medium	High	Keep claims subject to coverage. Avoid single-partner dependence where possible	Both
G-07	A competitor adds cross-currency netting	Medium	Medium	Test defensibility in the pilot. Compete on settlement experience and network	PM
G-08	Testnet-to-mainnet drop-off	Medium	High	Phase 2 mainnet pilot with small value before public launch	Both
G-09	Users expect enforcement of payment	Medium	Medium	Do not promise it. State the limit in copy. Consider escrow later	PM
G-10	Claims outrun evidence	Medium	High	Claims guardrails (4.5) and the PRD Verification Register	PM
G-11	Two-person team capacity	High	Medium	Sequence work by gates. Defer B2B and regulated streams	Both
G-12	FX movement between entry and cash-out leaves a member worse off	Medium	Medium	State the exposure plainly (1.5). Do not promise a local-currency value. Revisit rate handling before any real-money use	PM
G-13	Devices without an enrolled passkey, and Developer and Sample modes, sign without a biometric prompt (a slide or typed-amount confirmation in the consumer view)	Medium	Medium	Acceptable on testnet. Disclose it. Require re-authentication or limits before any real-money use	Dev

13. SUCCESS METRICS

Phase	Metrics	Targets (proposed)	Source
0. Hackathon	Payments within the guarantee. Balance invariants. Self-test completion. Comprehension and trust. Tap-to-confirmed median	PRD targets M-01 to M-10	PRD Section 3
1. Testnet pilot	Invite acceptance, activation, settle completion, next -tab starts, willingness to pay	Baselines set in the pilot	Section 9
2. Mainnet pilot	Real settlement success, cost per group, early paid conversion, support load	Set from Phase 1 and measured costs	Financial Model inputs replaced with measured values
Financial	Revenue and contribution per active group, variable cost per group, break-even scale	Model outputs tracked against measured data	Financial Model

14. FINAL STRATEGIC RECOMMENDATION

Proceed with a constrained, evidence-first GTM. Win the hackathon on a product judges can verify themselves. Use the invite link as the growth engine, keep the core free, and delay every revenue stream until the funnel works and the costs are measured. The financial model shows a free-core business is possible but depends on volume and on per-user platform costs that are not yet known. The honest position is that MeshTab has a clear product loop, a plausible beachhead, and several untested commercial hypotheses.

Window	Actions	Owner
Next 7 days	Close the PRD Verification Register items marked Must. Record the demo. Finish the landing-page copy pass. Optional: run the micro-survey	Both

Window	Actions	Owner
Next 30 days	Run the testnet pilot with 10 to 20 groups. Measure invite loop and settle completion. Obtain provider pricing for platform, paymaster and gas costs and replace the model's placeholders	Both
Next 90 days	Complete a security review and a legal opinion. Confirm ramp, card and currency coverage. Run a small mainnet pilot. Test a fake-door Trip Pass offer. Decide on B2B only with paid pilot commitments	Both

Appendix A: Evidence and Assumption Register

Claim	Status	Where the evidence is
76% of Gen Z fronters not fully repaid. 14% of Gen Z and 19% of Millennials ended a relationship over repayment	Sourced, US sample	PRD Appendix B, S1
Expense trackers net per currency. In-app payments limited to a few countries	Sourced, category behavior	PRD Appendix B, S2 to S5
Monad finality is 800 ms. Testnet and mainnet chain IDs	Sourced	PRD Appendix B, S7
Issuer's testnet token and faucet parameters	Dev-verified on-chain, links in the evidence pack	PRD Appendix B, S9, and V-16
Tap-to-confirmed: median 1.28 s, slowest 1.54 s over 10 runs on 2 devices (single-payment batched operation)	Dev-measured by stopwatch. Live -app transaction hashes provided	PRD V-04
Netting property test: 1,000 random tabs, balances sum to $0.00 and payments within the bound	Dev-run. Extension to 10,000 planned before mainnet	PRD V-03
Funding and card routes through Privy, with partner dependencies	Sourced from public docs. Coverage unconfirmed	PRD Appendix B, S10
Security scan sponsored for winning teams	Sourced	PRD Appendix B, S11
Statistics on cross-border payment cost, travel trends and friendships ending over money from earlier drafts	Not verified. Not used	Re-source before any use
Rates are fixed in dollars at entry. Rounding is deterministic	Specified in the PRD. Property tests pending	PRD FR-08, FR-11, M-04, V-03
Pilot recruiting counts and funnel rates	Illustrative placeholders	Financial Model, Pilot_Funnel sheet
Downside stress case (3% conversion, no B2B, $0.05 per user)	Illustrative. Not a quote	Financial Model, Stress sheet
Segment, channel, price and conversion assumptions	Hypotheses	Sections 2, 5, 6, 8
Card processing, OCR and gas cost rates	Assumptions to verify	Financial Model, Assumptions sheet
Platform, paymaster and B2B serving costs	Placeholders at $0	Financial Model, Assumptions and Checks sheets

Appendix B: Financial Model Guide

Sheet	What it does
Guide	Purpose, colour code, status labels and warnings
Assumptions	Every input with scenario columns, status and notes. Blue is input, yellow marks placeholders
Scenarios	Steady-state monthly economics, unit economics and break-even for three scenarios
Ramp24M	A 24-month ramp for the scenario selected in cell B3, with a cumulative chart
Sensitivity	Price and conversion grid, platform-cost test, and driver ranking

Sheet	What it does
Stress	A downside scenario built from Base case inputs with illustrative overrides, and the platform cost at which it breaks even
Pilot_Funnel	A bottom-up pilot recruiting and funnel estimate with yellow placeholder inputs
Upside	Streams excluded from the base case, with an illustrative sizing block
Reconciliation	Ties the model to the original proposal using its original assumptions
Checks	Integrity tests, including the new sheets. Currently PASS with three warnings for placeholders

File: MeshTab_Financial_Model_v1.1.xlsx (v1.0 is kept separately). Formulas are live. Change blue cells on the Assumptions sheet and everything recalculates.

Appendix C: Change Log

Version	Change
1.3	Aligned to the final code reading: settlement confirms by biometric check or slide or typed amount depending on the device, in-app nudge now exists, property-test result added. Companion documents updated
1.2	Settlement is one batched operation measured at a median of 1.28 s. Wording changed from biometric tap to one tap inside an authenticated passkey session. Risk G-13 added. Evidence rows updated. Screenshot removed
1.1	Added: how cross-currency netting works with FX exposure disclosure (1.5); why settle on-chain (1.6); narrowing the first experiment (2.5); bottom-up pilot funnel in place of market sizing (2.6); downside stress scenario (5.8); risk G-12; evidence and model-guide rows. Companion model updated to v1.1. Existing sections unchanged apart from renumbering in Section 5
1.0	Initial GTM Strategy
